

LAB 2: RECONNAISSANCE (CONDUCTING RECONNAISSANCE ON UTM NETWORK)

Name:	Keertennah Devi A/P Ponnambalam
Matric No:	MEC254026
Section:	25

Active reconnaissance will expose your identity to the target infrastructure once you make contact with the target infrastructure. To circumvent this, penetration tester and hackers will attempt to anonymize their traffic by masking the original source of the request. Three popular approaches are used, VPN, Proxies and The Onion Routing (TOR)

1. Using the **proxychains** tool create a chain of three (3) proxy servers and answer the following questions.
 - a. What were the proxy servers that was selected? Include the protocol, IP address and port numbers.

Protocol	IP Address	Port Numbers
SOCKS5	192.252.210.233	4145
SOCKS5	72.207.109.5	4145
SOCKS5	70.166.65.160	4145

```
[ProxyList]
# add proxy here ...
# meanwhile SOCKS5 HIA HK Hong Kong
# defaults set to "tor"
# socks5 192.252.210 233
socks5 72.207.109.5 4145
socks5 70.166.65.160 4145
_
```

- b. Using the **dnsleaktest** website, what is the IP address that is shown? At what country?

The IP address identified by the DNS leak test was 70.166.65.160, which was geolocated to the United States.

 [What is a DNS leak?](#) [How to fix a DNS leak](#) [WebRTC Leak Test](#)

Hello 70.166.65.160

from Roanoke, United States 

Standard test

Extended test

[What's the difference?](#)

LAB 2: RECONNAISSANCE (CONDUCTING RECONNAISSANCE ON UTM NETWORK)

- c. Rerun the `dnsenum` with the tool from LAB 1 to gather information from `utm.my`. Is there a difference in the result?

Yes, there is a significant difference. When `dnsenum` is executed through the proxy chain, the source of the DNS queries is masked. The target server `utm.my` and the intermediate DNS servers see the requests originating from the exit node of the proxy chain (in this case, `70.166.65.160`) instead of the tester's real IP address. While the actual DNS records (A, CNAME, MX, etc.) retrieved for `utm.my` remain the same, the origin of the reconnaissance activity is successfully anonymized.

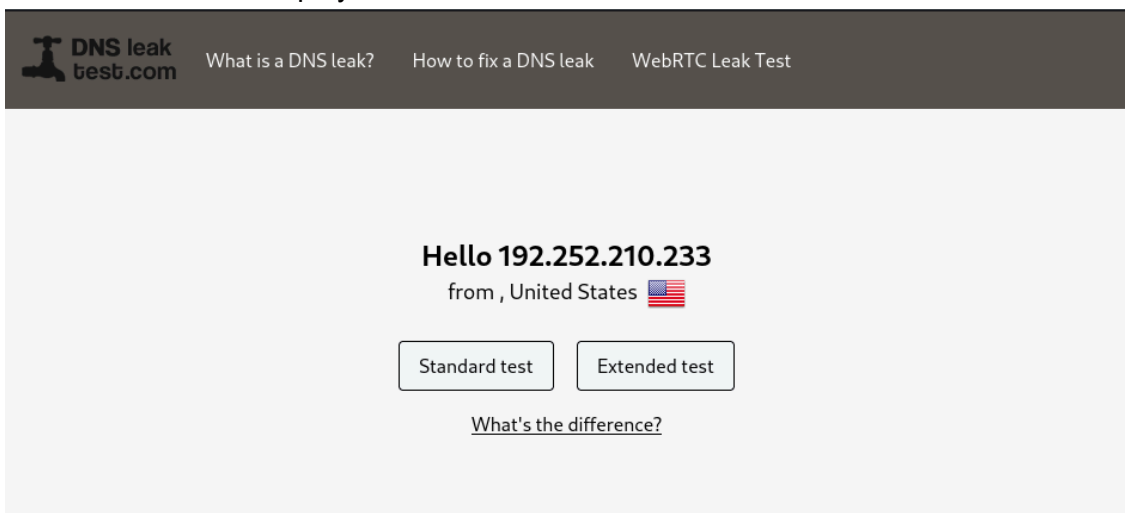

Trying Zone Transfers and getting Bind Versions:

```
root@kali:~# dnsenum -u utm.my -p 70.166.65.160:4145 -s 161.139.250.2:53 --proxychains
[proxychains] Dynamic chain  ...  72.207.109.5:4145  ...  70.166.65.160:4145  ...  161.139.250.2:53  ...  OK
Use of uninitialized value $size in integer subtraction (-) at /usr/share/perl5/Net/DNS/Resolver/Base.pm line 838.

Trying Zone Transfer for utm.my on ns1.utm.my ...
AXFR record query failed: corrupt packet
[proxychains] Dynamic chain  ...  72.207.109.5:4145  ...  70.166.65.160:4145  ...  161.139.168.168:53  ...  OK

Trying Zone Transfer for utm.my on ns3.utm.my ...
AXFR record query failed: REFUSED
```

2. Again, using the **proxychains** tool, configure TOR to anonymise your traffic and answer the following questions.
- a. What is the IP address displayed on the DNS leak test website?
The IP address displayed was `192.252.210.233`.

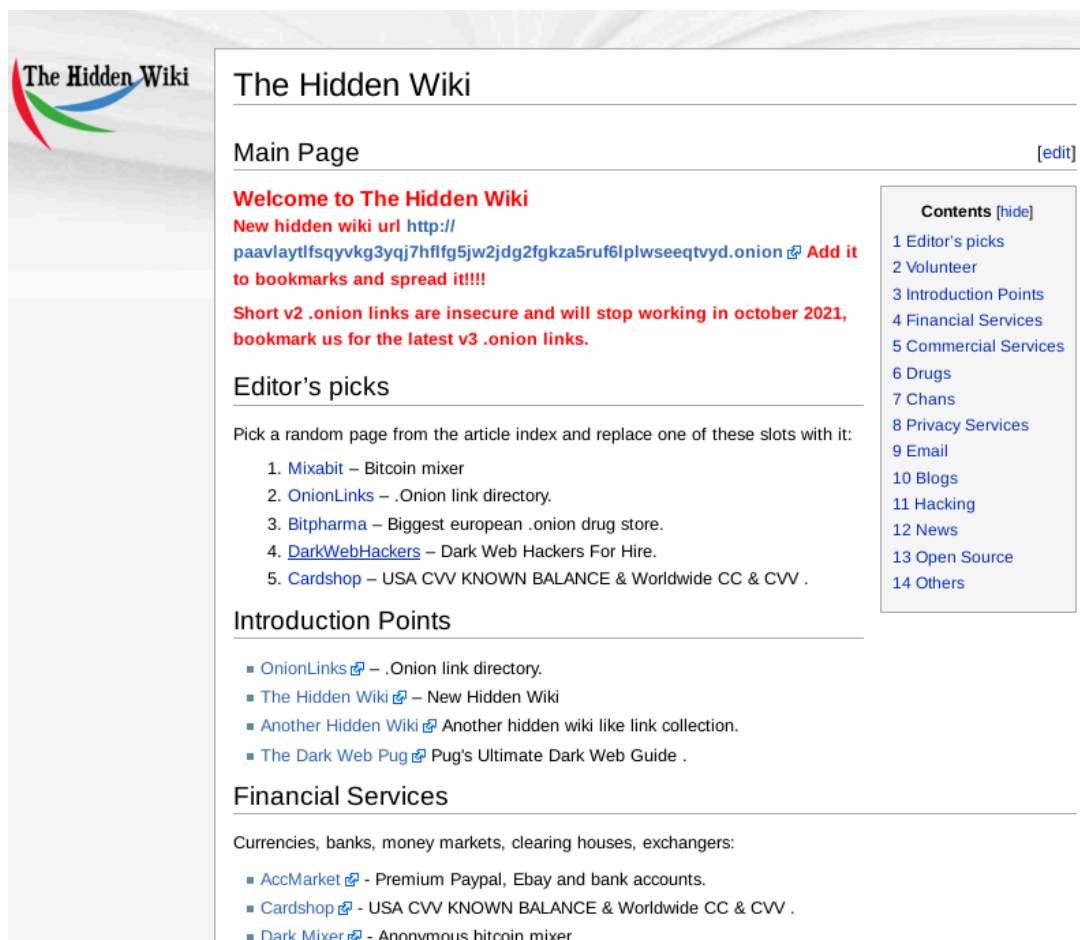

LAB 2: RECONNAISSANCE (CONDUCTING RECONNAISSANCE ON UTM NETWORK)

```
[ProxyList]
# add proxy here ...
# meanwhile
# defaults set to "tor"
socks5 192.252.210.233 4145
#socks5 72.207.109.5 4145
#socks5 70.166.65.160 4145
```

- d. Rerun the **dnsenum** with the tool from LAB 1 to gather information from utm.my. Is there a difference in the result?

Yes. Similar to the proxy chain, the source of the reconnaissance traffic is now a TOR exit node, effectively hiding your real IP address from utm.my and the DNS servers. The DNS records themselves will be the same, but the origin of the scan is anonymized.

3. Download and install the **TOR Browser** on your Kali Linux VM and go to the www.thehiddenwiki.com website.
- a. What are the websites that you managed to find in the thehiddenwiki website?

The screenshot shows the homepage of 'The Hidden Wiki'. The header includes the site's logo and name. Below the header, there's a 'Main Page' section with a welcome message and a new hidden wiki URL. A warning about insecure v2 .onion links is displayed. The page is organized into several sections: 'Editor's picks' with a list of five links, 'Introduction Points' with four links, and 'Financial Services' with three links. A 'Contents' sidebar on the right lists 14 categories from 'Editor's picks' to 'Others'. The page also includes an '[edit]' link in the top right corner of the main content area.

The Hidden Wiki

LAB 2: RECONNAISSANCE (CONDUCTING RECONNAISSANCE ON UTM NETWORK)

b. Click on one of the links to the website. Record the results.

a. What is the URL?

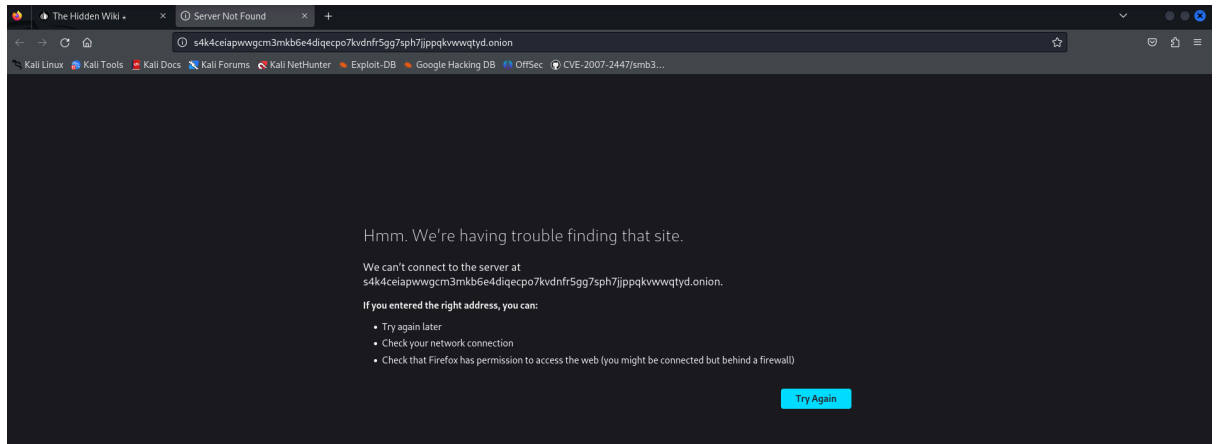

<http://s4k4ceiapwwgcm3mkb6e4diqecpo7kvdnfr5gg7sph7jjppqkvwwqtyd.onion/>

b. Screenshot of the webpage.

LAB 2: RECONNAISSANCE (CONDUCTING RECONNAISSANCE ON UTM NETWORK)

- c. Using the **proxychains** tool open Firefox and try to open the same website in (b). Do you manage to open it? If no, then discuss the reason.

No, I can't open .onion websites with a standard proxy chain. The .onion domain is a special-use domain suffix exclusively reserved for the TOR network. Standard DNS servers and proxies that rely on them cannot resolve these addresses. Only a client that is specifically configured to route traffic through the entire TOR network like the TOR Browser can connect to these services.
